

Gym Management System

Requirements Document

A multi-tenant Gym Management System is designed to help gym owners manage their gyms through one platform. The system stores information about gyms, users, membership plans, staff, attendance, and payments in one database. Each gym works independently, and the data of one gym cannot be accessed by another gym. Prepare an E-R model according to the following description.

- The system supports multiple gyms. Each gym has an ID, name, address, phone number, email, status, subscription status, and creation date. Every gym works independently from other gyms.
- A gym owner can register a new gym by entering the required information. The gym request is stored until it is reviewed by the System Admin.
- The System Admin can approve or reject gym registration requests. If the request is approved, the system creates a Gym Admin account and changes the gym status to Approved (Waiting Subscription).
- Before using the system, the Gym Admin must choose one subscription plan.
- The system stores different subscription plans. Each plan has an ID, name, duration, price, maximum number of members, maximum number of staff, and status.
- After choosing a subscription plan, the Gym Admin uploads the payment receipt. The payment is reviewed by the System Admin.
- If the payment is approved, the gym becomes Active and can use the dashboard. Otherwise, the Gym Admin can upload another payment receipt.
- The system stores user information. Each user has an ID, name, email, password, phone number, role, and status. Every user belongs to one gym except the System Admin.
- Users may have one of the following roles: System Admin, Gym Admin, Coach, Receptionist, or Member.
- Each gym can have many coaches and receptionists. Every staff member belongs to only one gym.
- The Gym Admin can add, update, suspend, or remove staff members.

- Each gym can create its own membership plans. Every membership plan has a name, duration, price, services, and status.
- The system stores sports supported by each gym. A gym can support many sports, and the same sport can be available in different gyms.
- Members can register in a gym by selecting a membership plan and uploading a payment receipt.
- The Gym Admin reviews member information and payment before approving or rejecting the membership.
- If the member is approved, the member status becomes Active. Otherwise, the member can update the information or upload another payment receipt.
- Coaches can be assigned to members. One coach can train many members, while each member is assigned to one coach at a time.
- The system stores attendance records. Each attendance record includes the member, check-in time, check-out time, attendance status, and the employee who recorded it.
- Attendance can be recorded manually by the Receptionist or by using a QR Code.
- The system stores financial transactions. Each transaction belongs to one gym and contains the transaction type, amount, payment method, category, and transaction date.
- Member subscription payments are recorded as income transactions.
- The system stores notifications for users.
- The system stores activity logs for important operations performed by users.
- The system provides reports for attendance, memberships, revenues, staff, and gym performance.
- Each gym can only access its own data, while the System Admin can access all gyms in the system.
- The system uses role-based authorization to control user permissions.
